ABSTRACT

CitationFlow Analytics is a graph-based citation analysis system designed to study the flow of knowledge among research papers. The system represents research papers as nodes and citation relationships as directed edges, forming a citation network. It analyzes these relationships to identify influential publications and determine how knowledge flows from one paper to another. Graph-based algorithms are used to calculate citation flow values, analyze connections, and rank papers based on their influence within the network. The system also provides visualization of citation paths and generates analytical reports to help users understand research impact and relationships. By efficiently processing citation networks, CitationFlow Analytics can support researchers, students, and academic institutions in discovering important publications, understanding research trends, and analyzing the dissemination of knowledge. The project demonstrates the practical application of graph data structures and network algorithms in real-world academic research analysis.
